

How did a Global Automotive Component Manufacturer Optimize for Safety and Security of their Product Design Data across the Organization?

India's Largest Global Automotive Component Manufacturer in the Two-Wheeler Cable market felt the need for upgrading their safety and security in their Product Design Management system across the Organization to handle the business growth and customer diversification. With multi-site projects, development changes in product data, the manufacturing company needed a single-platform product data management system. The tracking of new product development with the ability to handle changes from customers and the internal processes was required. The existing system lacked the tools to handle and secure the product data for part design.

The company leaders understood the need for introducing a system to optimize for a secure automotive component PLM process to establish real-time product data across the organization, so the manufacturing company was looking for a technology and software solutions provider.

EDS Technologies' consultants gathered the design and manufacturing process requirements and realized the need for the 3DEXPERIENCE Platform Implementation with a secure and agile one-platform manufacturing process across all the plants of the company.

Dassault Systemès' 3DEXperience Platform with deft Implementation from EDS Technologies helped improve the Safety and Efficiency of a Global Automotive Component Manufacturer across the company.

The Global Automotive Component Manufacturer safe-guarded their PLM process with the 3DEXPERIENCE Platform solution, ENOVIA to help with:

- Safety and Security in the PLM process
- Reduce in the part and document redundancy for production
- Unified platform for part design, documentation, and manufacturing
- Streamline the product development process with reduced cycles
- Zero-defect design and production process
- Reduce in overall costs and ROI

EDST Team and the automotive manufacturing company worked together to configure the 3DEXPERIENCE Platform for their needs to optimize the manufacturing process by improving the overall safety and agility of the PLM process.

EDST team provided user acceptance testing, data migration, user training and support.
